me

This is a picture of me after I recently graduated at UC. I got my degree in Sports Administration and decided I wanted to get an advanced education in Data Analytics so I began this graduate certificate journey.

I graduated with Magna Cum Laude honors and made dean's list every semester. I plan using my education to pursue a career in professional baseball operations, specifically data analytics or advanced scouting.

Currently I have two internships. One is with Archbishop Moeller High School Baseball as a data and video intern. I run the twitter for our analytics account, chart games, and run data reports for coaches and players using Python and other software. The other internship just started with the Joliet Slammers, a professional baseball team in the Frontier League. I am currently doing advanced scouting of opponents.

I began teaching myself Python by watching videos on YouTube a year and a half ago. I watched a guy that is the Director of Analytics use Python to analyze baseball and I instantly grew interested in learning more, so I took an Intro to Python class in my undergrad. I have a basic understanding of the language, but I am excited to learn more and what else I can do with it.
